1. INTRODUCTION

This document lists the manual steps for the installation and configuration of a LCG WN Node. Furthermore it provides a specification of the YAIM functions used to configure the node with the script-based configuration.

The configuration has been tested on a standard Scientific Linux 3.0 Installation.

Link to this document:

This document is available on the *Grid Deployment* web site

<http://www.cern.ch/grid-deployment/gis/lcg-GCR/index.html>

2. VARIABLES

In order to set-up a WN node, you need at least the following variables to be correctly configured in the site configuration file (site-info.def):

BDII_HOST : BDII Hostname.

CE_HOST : Computing Element Hostname.

DPM_HOST : Host name of the DPM host, used also as a default DPM for the lcg-stdout-mon .

EDG_WL_SCRATCH : Optional scratch directory for jobs.

EDG_WL_SCRATCH : Optional scratch directory for jobs.

FTS_SERVER_URL : URL of the File Transfer Service server.

GLOBUS_TCP_PORT_RANGE : Port range for Globus IO.

GRIDICE_SERVER_HOST : GridIce server host name (usually run on the MON node).

GSSKLOG : yes or no, indicating whether the site provides an AFS authentication server which maps gsi credentials into Kerberos tokens .

GSSKLOG_SERVER : If GSSKLOG is yes, the name of the AFS authentication server host.

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

JAVA_LOCATION : Path to Java VM installation. It can be used in order to run a different version of java installed locally.

JOB_MANAGER : The name of the job manager used by the gatekeeper.

MON_HOST : MON Box Hostname.

PX_HOST : PX hostname.

RB_HOST : Resource Broker Hostname.

REG_HOST : RGMA Registry hostname.

SE_LIST : A list of hostnames of the SEs available at your site.

SITE_NAME : Your GIIS.

USERS_CONF : Path to the file containing a list of Linux users (pool accounts) to be created. This file should be created by the Site Administrator, which contains a plain list of the users and IDs. An example of this configuration file is given in /opt/lcg/yaim/examples/users.conf.

VOBOX_HOST : VOBOX hostname.

VOBOX_PORT : The port the VOBOX gsisshd listens on.

VOS : List of supported VOs. For each item listed in the VOS variable you need to create a set of new variables as follows:

VO_<VO-NAME>_SE : Default SE used by the VO. WARNING: VO-NAME must be in capital cases.

VO_<VO-NAME>_SW_DIR : Area on the WN for the installation of the experiment software. If on the WNs a predefined shared area has been mounted where VO managers can pre-install software, then these variable should point to this area. If instead there is not a shared area and each job must install the software, then this variables should contain a dot (.). Anyway the mounting of shared areas, as well as the local installation of VO software is not managed by *yaim* and should be handled locally by Site Administrators. WARNING: VO-NAME must be in capital cases.

3. CONFIGURE LIBRARY PATHS

Author(s): Retico, Antonio

Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function *'config_ldconf'*.

In order to allow the middleware libraries to be looked up and dynamically linked, the relevant paths need to be configured.

- If not already there, append the following lines to the file */etc/ld.so.conf*

```
<INSTALL_ROOT>/globus/lib
<INSTALL_ROOT>/edg/lib
<INSTALL_ROOT>/lcg/lib
/usr/local/lib
/usr/kerberos/lib
/usr/X11R6/lib
/usr/lib/qt-3.1/lib
/opt/gcc-3.2.2/lib
```

where *<INSTALL_ROOT>* is the installation root of the lcg middleware (*/opt* by default).

- Run the command:

```
> /sbin/ldconfig -v
```

(this command produces a huge amount of output)

3.1. SPECIFICATION OF FUNCTION: CONFIG_LDCONF

The function *'config_ldconf'* needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_ldconf
```

The code is reproduced also in 20.1..

4. SET-UP EDG CONFIGURATION VARIABLES

Author(s): Retico, Antonio

Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_sysconfig_edg*'.

The EDG configuration file is parsed by EDG daemons to locate the EDG root directory and various other global properties.

Create and edit the file */etc/sysconfig/edg* as follows:

```
EDG_LOCATION=<INSTALL_ROOT>/edg
EDG_LOCATION_VAR=<INSTALL_ROOT>/edg/var
EDG_TMP=/tmp
X509_USER_CERT=/etc/grid-security/hostcert.pem
X509_USER_KEY=/etc/grid-security/hostkey.pem
GRIDMAP=/etc/grid-security/grid-mapfile
GRIDMAPDIR=/etc/grid-security/gridmapdir/
```

where *<INSTALL_ROOT>* is the installation root of the lcg middleware (*/opt* by default).

NOTE: it might be observed that some of the variables above listed dealing with the GSI (Grid Security Interface) are needed just on service nodes (e.g. CE, RB) and not on others. Nevertheless, for sake of simplicity, *yaim* uses the same definitions on all node types, which has been proven not to hurt.

4.1. SPECIFICATION OF FUNCTION: CONFIG_SYSCONFIG_EDG

The function '*config_sysconfig_edg*' needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_sysconfig_edg
```

The code is reproduced also in 20.2..

5. SET-UP GLOBUS CONFIGURATION VARIABLES

Author(s): Retico, Antonio

Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_sysconfig_globus*'.

Create and edit the file */etc/sysconfig/globus* as follows:

```
GLOBUS_LOCATION=<INSTALL_ROOT>/globus
GLOBUS_CONFIG=/etc/globus.conf
GLOBUS_TCP_PORT_RANGE="20000 25000"
export LANG=C
```

where *<INSTALL_ROOT>* is the installation root of the lcg middleware (*/opt* by default).

5.1. SPECIFICATION OF FUNCTION: CONFIG_SYSCONFIG_GLOBUS

The function '*config_sysconfig_globus*' needs the following variables to be set in the configuration file:

GLOBUS_TCP_PORT_RANGE : Port range for Globus IO.

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_sysconfig_globus
```

The code is reproduced also in 20.3..

6. SET-UP LCG CONFIGURATION VARIABLES

Author(s): Retico, Antonio

Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_sysconfig_lcg*'.

Create and edit the file */etc/sysconfig/lcg* as follows:

```
LCG_LOCATION=<INSTALL_ROOT>/lcg
LCG_LOCATION_VAR=<INSTALL_ROOT>/lcg/var
LCG_TMP=/tmp
```

where *<INSTALL_ROOT>* is the installation root of the *lcg* middleware (*/opt* by default).

6.1. SPECIFICATION OF FUNCTION: CONFIG_SYSCONFIG_LCG

The function '*config_sysconfig_lcg*' needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

SITE_NAME : Your GIIS.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_sysconfig_lcg
```

The code is reproduced also in 20.4..

7. SET-UP UPDATING OF CRLS

Author(s): Vidic, Valentin

Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_crl*'.

Cron script is installed to fetch new versions of CRLs four times a day. The time when the script is run is randomized in order to distribute the load on CRL servers. If the configuration is run as root, the cron entry is installed in */etc/cron.d/edg-fetch-crl*, otherwise it is installed as a user cron entry.

CRLs are also updated immediately by running the update script (*<INSTALL_ROOT>/edg/etc/cron/edg-fetch-crl-cron*).

Logrotate script is installed as */etc/logrotate.d/edg-fetch-crl* to prevent the logs from growing indefinitely.

7.1. SPECIFICATION OF FUNCTION: CONFIG_CRL

The function '*config_crl*' needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_crl
```

The code is reproduced also in 20.5..

8. SET-UP RFIO

Author(s): Vidic, Valentin

Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_rfio*'.

rfiod is configured on SE_classic nodes by adding the appropriate ports (5001 TCP and UDP) to */etc/services* and restarting the daemon.

For SE_dpm nodes, *rfiod* is configured by *config_DPM_rfio* so no configuration is done here.

All other nodes don't run *rfiod*. However, *rfiod* might still be installed from *CASTOR-client* RPM. If this is the case, we make sure it's stopped and disabled.

8.1. SPECIFICATION OF FUNCTION: CONFIG_RFIO

The function '*config_rfio*' needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

The original code of the function can be found in:

`/opt/lcg/yaim/functions/config_rfio`

The code is reproduced also in 20.6..

9. SET-UP GLOBUS DAEMONS

Author(s): Vidic, Valentin

Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_globus*'.

The Globus configuration file */etc/globus.conf* is parsed by Globus daemon startup scripts to locate the Globus root directory and other global/daemon specific properties. The contents of the configuration file depend on the type of the node. The following table contains information on daemon to node mapping:

node/daemon	MDS	GridFTP	Gatekeeper
CE	yes	yes	yes
VOBOX	yes	yes	yes
SE_*	yes	yes	no
SE_dpm	yes	no	no
PX	yes	no	no
RB	yes	no	no
LFC	yes	no	no
GridICE	yes	no	no

Note that SE_dpm does not run standard GridFTP server, but a specialized DPM version.

The configuration file is divided into sections:

common Defines Globus installation directory, host certificates, location of gridmap file etc.

mds Defines information providers.

gridftp Defines the location of the GridFTP log file.

gatekeeper Defines jobmanagers and their parameters.

Logrotate scripts *globus-gatekeeper* and *gridftp* are installed in */etc/logrotate.d/*.

Globus initialization script (*<INSTALL_DIR>/globus/sbin/globus-initialization.sh*) is run next.

Finally, the appropriate daemons (*globus-mds*, *globus-gatekeeper*, *globus-gridftp*, *lcg-mon-gridftp*) are started (and configured to start on boot).

9.1. SPECIFICATION OF FUNCTION: CONFIG_GLOBUS

The function '*config_globus*' needs the following variables to be set in the configuration file:

CE_HOST : Computing Element Hostname.

GRIDICE_SERVER_HOST : GridIce server host name (usually run on the MON node).

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

JOB_MANAGER : The name of the job manager used by the gatekeeper.

PX_HOST : PX hostname.

RB_HOST : Resource Broker Hostname.

SITE_NAME : Your GIIS.

The original code of the function can be found in:

`/opt/lcg/yaim/functions/config_globus`

The code is reproduced also in 20.7..

10. SET-UP LCG ENVIRONMENT VARIABLES

Author(s): Retico, Antonio

Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_lcgenv*'.

The LCG middleware needs some environment variables to be set up at boot time. The variable should be available both in 'bash-like' shells and in 'csh-like' shells.

This can be obtained in different ways:

The simplest way, if you have 'root' permissions, is to put a shell script for each of the supported shell 'families' in the directory */etc/profile.d*. The script will be automatically sourced at start up.

If instead you are not a superuser and you are doing the installation in a private directory (e.g. you are installing a Re-locatable Distribution of a Worker Node or a User Interface in the *<INSTALL_ROOT>* directory), you could create the scripts in the directory *<INSTALL_ROOT>/etc/profile.d*, in order to have the variables automatically set up by LCG tools.

The list of the environment variables to be set up follows:

LCG_GFAL_INFOSYS: Hostname of the BDII node.

MYPROXY_SERVER: Hostname of the Proxy server.

PATH: Add to the PATH variable the path */opt/d-cache-client/bin*

LD_LIBRARY_PATH: Add to the LD_LIBRARY_PATH variable the path */opt/d-cache-client/dcap*

SRM_PATH: Installation directory of the srm client. The default value for this variable is */opt/d-cache-client/srm*

VO_<VO-NAME>_SW_DIR: For each virtual organization <VO-NAME> An environment variable VO_<VO-NAME>_SW_DIR is needed. This variable points to the installation directory of the VO software.

VO_<VO-NAME>_DEFAULT_SE: For each virtual organization <VO-NAME> An environment variable VO_<VO-NAME>_DEFAULT_SE is needed. This variable points to the Default Storage Element for that VO.

The examples given hereafter refer to the simple configuration method described above. In the following description we will refer to the two possible locations as to the *<LCG_ENV_LOC>*. So, according to the cases above described, either

<LCG_ENV_LOC>=/etc/profile.d

or

`<LCG_ENV_LOC>=<INSTALL_ROOT>/etc/profile.d`

Examples:

- Example of file `<LCG_ENV_LOC>/lcgen.sh`:

```
#!/bin/sh
export LCG_GFAL_INFOSYS=lxlb1769.cern.ch:2170
export MYPROXY_SERVER=lxlb1774.cern.ch
export PATH="${PATH}:/opt/d-cache-client/bin"
export LD_LIBRARY_PATH=${LD_LIBRARY_PATH}:/opt/d-cache-client/dcap
export SRM_PATH=/opt/d-cache-client/srm
export VO_ATLAS_SW_DIR=lxlb1780.cern.ch
export VO_ATLAS_DEFAULT_SE=lxlb1780.cern.ch
export VO_ALICE_SW_DIR=lxlb1780.cern.ch
export VO_ALICE_DEFAULT_SE=lxlb1780.cern.ch
export VO_LHCB_SW_DIR=lxlb1780.cern.ch
export VO_LHCB_DEFAULT_SE=lxlb1780.cern.ch
export VO_CMS_SW_DIR=lxlb1780.cern.ch
export VO_CMS_DEFAULT_SE=lxlb1780.cern.ch
export VO_DTEAM_SW_DIR=lxlb1780.cern.ch
export VO_DTEAM_DEFAULT_SE=lxlb1780.cern.ch
```

- Example of file `<LCG_ENV_LOC>/lcgen.csh`:

```
#!/bin/csh
setenv LCG_GFAL_INFOSYS lxb1769.cern.ch:2170
setenv MYPROXY_SERVER lxb1774.cern.ch
setenv PATH "${PATH}:/opt/d-cache-client/bin"
setenv LD_LIBRARY_PATH ${LD_LIBRARY_PATH}:/opt/d-cache-client/dcap
setenv SRM_PATH /opt/d-cache-client/srm
setenv VO_ATLAS_SW_DIR lxb1780.cern.ch
setenv VO_ATLAS_DEFAULT_SE lxb1780.cern.ch
setenv VO_ALICE_SW_DIR lxb1780.cern.ch
setenv VO_ALICE_DEFAULT_SE lxb1780.cern.ch
setenv VO_LHCB_SW_DIR lxb1780.cern.ch
setenv VO_LHCB_DEFAULT_SE lxb1780.cern.ch
setenv VO_CMS_SW_DIR lxb1780.cern.ch
setenv VO_CMS_DEFAULT_SE lxb1780.cern.ch
setenv VO_DTEAM_SW_DIR lxb1780.cern.ch
setenv VO_DTEAM_DEFAULT_SE lxb1780.cern.ch
```

WARNING: The two scripts must be executable by all users.

```
> chmod a+x ${LCG_ENV_LOC}/lcgen.csh
> chmod a+x ${LCG_ENV_LOC}/lcgen.sh
```

10.1. SPECIFICATION OF FUNCTION: CONFIG_LCGENV

The function '*config_lcgen*' needs the following variables to be set in the configuration file:

BDII_HOST : BDII Hostname.

CE_HOST : Computing Element Hostname.

DPM_HOST : Host name of the DPM host, used also as a default DPM for the *lcg-stdout-mon* .

EDG_WL_SCRATCH : Set this if you want jobs to use a particular scratch area.

EDG_WL_SCRATCH : Set this if you want jobs to use a particular scratch area.

GLOBUS_TCP_PORT_RANGE : Port range for Globus IO.

GSSKLOG : yes or no, indicating whether the site provides an AFS authentication server which maps gsi credentials into Kerberos tokens .

GSSKLOG_SERVER : If GSSKLOG is yes, the name of the AFS authentication server host.

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

PX_HOST : PX hostname.

SE_LIST : A list of hostnames of the SEs available at your site.

SITE_NAME : Your GIIS.

VOBOX_HOST : VOBOX hostname.

VOS : List of supported VOs. For each item listed in the VOS variable you need to create a set of new variables as follows:

VO_<VO-NAME>_SE : Default SE used by the VO. WARNING: VO-NAME must be in capital cases.

VO_<VO-NAME>_SW_DIR : Area on the WN for the installation of the experiment software. If on the WNs a predefined shared area has been mounted where VO managers can pre-install software, then these variable should point to this area. If instead there is not a shared area and each job must install the software, then this variables should contain a dot (.). Anyway the mounting of shared areas, as well as the local installation of VO software is not managed by *yaim* and should be handled locally by Site Administrators. WARNING: VO-NAME must be in capital cases.

The function does exit with return code 1 if they are not set.

The original code of the function can be found in:

`/opt/lcg/yaim/functions/config_lcgen`

The code is reproduced also in 20.8..

11. SET-UP REPLICA MANAGER

Author(s): Vidic, Valentin

Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function *'config_replica_manager'*.

Variable substitutions are generated in `<INSTALL_ROOT>/edg/etc/edg-replica-manager/edg-replica-manager.conf.values_local`:

```
@EDG.LOCATION@|<INSTALL_ROOT>/edg|location of edg middleware
@LOCALDOMAIN@|<domain>|the local domain
@DEFAULT.SE@|<SE_HOST>|the host of the close SE
@DEFAULT.CE@|<CE_HOST>|the host of the close CE
@INFOSERVICE@|MDS|The info provider to use. It can be Stub, MDS or RGMA
@RLS.MODE@|LrcOnly|The mode the RLS should be run in. LrcOnly or WithRli
@STUBFILE@||The properties file for the static file - only needed in Stub mode
@MDS.HOST@|<BDII_HOST>|The host of the MDS info provider
@MDS.PORT@|2170|The port of the MDS info provider
@ROS.FAILURE@|false|Fail if no ROS is available
@CONF.GCC@|_gcc3_2_2|The gcc suffix as used on the build box (empty for 2.95, _gcc3_2_2 for 3.2.)
@IGNORE.PREFIX@|true|Whether the RM will ignore the lfn and guid prefix.
@GRIDFTP.DCAU@|false|Does GridFTP use Data Channel Authentication (DCAU)
@GRIDFTP.STREAMS.SMALL@|1|The default number of stream to use for a small file
@GRIDFTP.STREAMS.BIG@|3|The default number of stream to use for a big file
@GRIDFTP.FILESIZE.THRESHOLD@|100|The Threshold (in MB) above which a file to transfer is considered "big"
```

The value of `<domain>` is determined by running *hostname -d*. Using these substitutions and templates in `<INSTALL_ROOT>/edg/etc/edg-replica-manager/`, Replica Manager is configured by generating files in `<EDG_LOCATION>/var/etc/edg-replica-manager`:

```
<INSTALL_ROOT>/edg/sbin/edg-replica-manager-configure <INSTALL_ROOT>/edg/etc/edg-replica-manager/edg-replica-manage
```

11.1. SPECIFICATION OF FUNCTION: CONFIG_REPLICA_MANAGER

The function *'config_replica_manager'* needs the following variables to be set in the configuration file:

BDII_HOST : BDII Hostname.

CE_HOST : Computing Element Hostname.

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

SE_LIST : A list of hostnames of the SEs available at your site.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_replica_manager
```

The code is also reproduced in 20.9..

12. CREATE POOL ACCOUNTS

Author(s): Vidic, Valentin

Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_users*'.

config_users creates pool accounts for grid users defined in *users.conf*. Each line in this file describes one user:

```
UID:LOGIN:GID:GROUP:VO:SGM_FLAG:
```

First, the format of the *users.conf* file is checked (VO and SGM fields were added recently).

Groups are then created for the supported VOs (listed in *<VOS>* variable) using *groupadd*.

For each of the lines in *users.conf*, a user account is created (with *useradd*) if that user's VO is supported.

Finally, grid users are denied access to *cron* and *at* by adding their usernames to */etc/at.deny* and */etc/cron.deny*.

12.1. SPECIFICATION OF FUNCTION: CONFIG_USERS

The function '*config_users*' needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

USERS_CONF : Path to the file containing a list of Linux users (pool accounts) to be created. This file should be created by the Site Administrator, which contains a plain list of the users and IDs. An example of this configuration file is given in */opt/lcg/yaim/examples/users.conf*.

VOS : List of supported VOs.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_users
```

The code is reproduced also in 20.10..

13. CREATE EXPERIMENT SOFTWARE DIRECTORIES

Author(s): Vidic, Valentin

Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_sw_dir*'.

For each of the supported VOs, experiment software directory is created as specified by `<VO_<vo>_SW_DIR>` variable.

Ownership of the created directory is changed to VO's SGM user and group.

It is assumed that `<VO_<vo>_SW_DIR>` is NFS mounted so that running this function on a WN will create software directories for the whole site.

13.1. SPECIFICATION OF FUNCTION: CONFIG_SW_DIR

The function '*config_sw_dir*' needs the following variables to be set in the configuration file:

VOS : List of supported VOs. For each item listed in the VOS variable you need to create a set of new variables as follows:

VO_<VO-NAME>_SW_DIR : Area on the WN for the installation of the experiment software. If on the WNs a predefined shared area has been mounted where VO managers can pre-install software, then these variable should point to this area. If instead there is not a shared area and each job must install the software, then this variables should contain a dot (.). Anyway the mounting of shared areas, as well as the local installation of VO software is not managed by *yaim* and should be handled locally by Site Administrators. **WARNING**: VO-NAME must be in capital cases.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_sw_dir
```

The code is also reproduced in 20.11..

14. SET-UP JAVA LOCATION

Author(s): Vidic, Valentin

Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_java*'.

Since Java is not included in the LCG distribution, Java location needs to be configured with *yaim*.

If `<JAVA_LOCATION>` is not defined in *site-info.def*, it is determined from installed Java RPMs (if available).

In relocatable distribution, `JAVA_HOME` environment variable is defined in `<INSTALL_ROOT>/etc/profile.d/grid_en` and `<INSTALL_ROOT>/etc/profile.d/grid_env.csh`.

Otherwise, `JAVA_HOME` is defined in `/etc/java/java.conf` and `/etc/java.conf` and Java binaries added to `PATH` in `<INSTALL_ROOT>/edg/etc/profile.d/j2.sh` and `<INSTALL_ROOT>/edg/etc/profile.d/j2.csh`.

14.1. SPECIFICATION OF FUNCTION: CONFIG_JAVA

The function '*config_java*' needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

JAVA_LOCATION : Path to Java VM installation. It can be used in order to run a different version of java installed locally.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_java
```

The code is reproduced also in 20.12..

15. SET-UP R-GMA CLIENT

Author(s): Vidic, Valentin

Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_rgma_client*'.

R-GMA client configuration is generated in `<INSTALL_ROOT>/glite/etc/rgma/rgma.conf` by running:

```
<INSTALL_ROOT>/glite/share/rgma/scripts/rgma-setup.py --secure=no --server=<MON_HOST> --registry=<REG_HOST> --scheme=<SCHEME>
```

`<INSTALL_ROOT>/edg/etc/profile.d/edg-rgma-env.sh` and `<INSTALL_ROOT>/edg/etc/profile.d/edg-rgma-env.csh` with the following functionality:

- `RGME_HOME` is set to `<INSTALL_ROOT>/glite`
- `APEL_HOME` is set to `<INSTALL_ROOT>/glite`
- `<INSTALL_ROOT>/glite/lib/python` is added to `PYTHONPATH`
- `<INSTALL_ROOT>/glite/lib` is added to `LD_LIBRARY_PATH`.

These files are sourced into the users environment from `<INSTALL_ROOT>/etc/profile.d/z_edg_profile.sh` and `<INSTALL_ROOT>/etc/profile.d/z_edg_profile.csh`.

15.1. SPECIFICATION OF FUNCTION: CONFIG_RGMA_CLIENT

The function '*config_rgma_client*' needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

MON_HOST : MON Box Hostname.

REG_HOST : RGMA Registry hostname.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_rgma_client
```

The code is also reproduced in 20.13..

16. SET-UP WORKLOAD MANAGER ENVIRONMENT

Author(s): Vidic, Valentin

Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_workload_manager_env*'.

`<INSTALL_ROOT>/edg/etc/profile.d/edg-wl.csh` and `<INSTALL_ROOT>/edg/etc/profile.d/edg-wl.sh` are copied to `<INSTALL_ROOT>/edg/var/etc/profile.d/`.

They are sourced into the user environment upon login (`/etc/profile.d/z_edg-profile.(c)sh`).

16.1. SPECIFICATION OF FUNCTION: CONFIG_WORKLOAD_MANAGER_ENV

The function '*config_workload_manager_env*' needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

The original code of the function can be found in:

`/opt/lcg/yaim/functions/config_workload_manager_env`

The code is also reproduced in 20.14..

17. SET-UP FILE TRANSFER SERVICE CLIENT

Author(s): Vidic, Valentin

Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_fts_client*'.

If `<FTS_SERVER_URL>` is set, gLite FTS client is configured by creating `<INSTALL_ROOT>/glite/etc/services.xml`.

```
<services>

  <service name="EGEEfts">
    <parameters>
      <endpoint><FTS_SERVER_URL>/services/FileTransfer</endpoint>
      <type>org.glite.FileTransfer</type>
      <version>3.0.0</version>
    </parameters>
  </service>

  <service name="EGEEchannel">
    <parameters>
      <endpoint><FTS_SERVER_URL>/services/ChannelManagement</endpoint>
      <type>org.glite.ChannelManagement</type>
      <version>3.0.0</version>
    </parameters>
  </service>

</services>
```

17.1. SPECIFICATION OF FUNCTION: CONFIG_FTS_CLIENT

The function '*config_fts_client*' needs the following variables to be set in the configuration file:

FTS_SERVER_URL : URL of the File Transfer Service server.

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_fts_client
```

The code is also reproduced in 20.15..

18. SET-UP GLITE ENVIRONMENT

Author(s): Vidic, Valentin

Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function *'config_glite_env'*.

/etc/profile.d/gliteenv.sh and */etc/profile.d/gliteenv.csh* are created. These scripts set environment variables needed to run gLite programs, for example */etc/profile.d/gliteenv.sh*:

```
if test "x${LCG_ENV_SET+x}" = x; then

    GLITE_LOCATION=${GLITE_LOCATION:-/opt/glite}
    GLITE_LOCATION_VAR=${GLITE_LOCATION_VAR:-$GLITE_LOCATION/var}
    GLITE_LOCATION_LOG=${GLITE_LOCATION_LOG:-$GLITE_LOCATION/log}
    GLITE_LOCATION_TMP=${GLITE_LOCATION_TMP:-$GLITE_LOCATION/tmp}

    if [ -z "$PATH" ]; then
        PATH=${GLITE_LOCATION}/bin:${GLITE_LOCATION}/externals/bin"
    else
        PATH=${PATH}:${GLITE_LOCATION}/bin:${GLITE_LOCATION}/externals/bin"
    fi

    if [ -z "$LD_LIBRARY_PATH" ]; then
        LD_LIBRARY_PATH=${GLITE_LOCATION}/lib:${GLITE_LOCATION}/externals/lib"
    else
        LD_LIBRARY_PATH=${LD_LIBRARY_PATH}:${GLITE_LOCATION}/lib:${GLITE_LOCATION}/externals/lib"
    fi

    if [ -z "$PERLLIB" ]; then
        PERLLIB=${GLITE_LOCATION}/lib/perl5"
    else
        PERLLIB=${PERLLIB}:${GLITE_LOCATION}/lib/perl5"
    fi

    if [ -z "$MANPATH" ]; then
        MANPATH=${GLITE_LOCATION}/share/man"
    else
        MANPATH=${MANPATH}:${GLITE_LOCATION}/share/man"
    fi

    export GLITE_LOCATION GLITE_LOCATION_VAR GLITE_LOCATION_LOG GLITE_LOCATION_TMP PATH LD_LIBRARY_PATH PERLLIB MANPATH

fi
```

/etc/profile.d/gliteenv.csh has the same functionality but for CSH compatible shells.

18.1. SPECIFICATION OF FUNCTION: CONFIG_GLITE_ENV

The function *'config_glite_env'* needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

The original code of the function can be found in:

`/opt/lcg/yaim/functions/config_glite_env`

The code is also reproduced in 20.16..

19. SET-UP GSI ENABLED SSH

Author(s): Vidic, Valentin

Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_gsissh*'.

First, the generic configuration script (`<INSTALL_ROOT>/globus/setup/gsi_openssh_setup/setup_openssh`) is run (if it exists). It will generate host keys and a default configuration.

At the moment, further configuration is only done for *VOBOX* nodes.

Configuration files for SSH daemon and client are modified to use GSI authentication. All other authentication types and root login are disabled for the daemon.

The startup script is modified to make the *gsisshd* listen on a nondefault port (`<VOBOX_PORT>`). It is then installed as `/etc/init.d/gsisshd`. The *gsisshd* daemon is restarted and configured to start on boot.

19.1. SPECIFICATION OF FUNCTION: CONFIG_GSISSH

The function '*config_gsissh*' needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

VOBOX_PORT : The port the *VOBOX* *gsisshd* listens on.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_gsissh
```

The code is also reproduced in 20.17..

20. SOURCE CODE

20.1. CONFIG_LDCONF

```
config_ldconf () {  
  
    INSTALL_ROOT=${INSTALL_ROOT:-/opt}  
  
    cp -p /etc/ld.so.conf /etc/ld.so.conf.orig  
  
    LIBDIRS="${INSTALL_ROOT}/globus/lib \  
    ${INSTALL_ROOT}/edg/lib \  
        ${INSTALL_ROOT}/edg/externals/lib/ \  
    /usr/local/lib \  
        ${INSTALL_ROOT}/lcg/lib \  
        /usr/kerberos/lib \  
        /usr/X11R6/lib \  
        /usr/lib/qt-3.1/lib \  
        ${INSTALL_ROOT}/gcc-3.2.2/lib \  
        ${INSTALL_ROOT}/glite/lib \  
        ${INSTALL_ROOT}/glite/externals/lib"  
  
    if [ -f /etc/ld.so.conf.add ]; then  
rm -f /etc/ld.so.conf.add  
    fi  
  
    for libdir in ${LIBDIRS}; do  
if ( ! grep -q $libdir /etc/ld.so.conf && [ -d $libdir ] ); then  
    echo $libdir >> /etc/ld.so.conf.add  
fi  
done  
  
    if [ -f /etc/ld.so.conf.add ]; then  
sort -u /etc/ld.so.conf.add >> /etc/ld.so.conf  
rm -f /etc/ld.so.conf.add  
    fi  
  
    /sbin/ldconfig  
  
    return 0  
}
```

20.2. CONFIG_SYSCONFIG_EDG

```
config_sysconfig_edg() {  
  
    INSTALL_ROOT=${INSTALL_ROOT:-/opt}  
  
    cat <<EOF > /etc/sysconfig/edg
